

You are making platform decisions on data you cannot fully trust.

Your CMDB contains unknown integrity failures. Your configurations carry misalignments no one has formally inventoried. Access controls, ownership records, and automation scripts have accumulated years of drift. No one on your team has a complete view because no systematic, full-coverage analysis has ever been run.

OrynIQ runs that analysis. Every record. Every check. Every dimension of risk - quantified.

450+ Automated checks	16 Compound Agentic analyzers	5 Health dimensions	3 yr ROI projection
---------------------------------	---	-------------------------------	-------------------------------

Five Dimensions of Platform Risk

Completeness	Required fields unpopulated, mandatory relationships missing - making your data unreliable for dependent workflows
Accuracy	Format violations and invalid field values silently degrading data quality across your instance
Relationships	Broken reference integrity and hierarchy inconsistencies that undermine every CMDB-dependent process
Ownership	Records without accountable owners - a governance gap that compounds with every change cycle
Staleness	Inactive records and configurations past their review date driving false positives and operational waste

What OrynIQ Replaces

	Traditional Assessment	With OrynIQ
Timeline	2-3 weeks of consultant preparation before a single finding is documented	Same-day results - no ramp-up required.
Coverage	Consultants sample. Risk hides in what they don't look at.	Every record evaluated without blind spots. Deterministic checks across your full instance.
Business case	ROI built on hourly rate guesses and assumed effort - not defensible metrics.	Quantified operational waste, 3-year ROI projection, and estimated payback period - calculated from actual findings.
Remediation	Slide decks that require you to take action or pay extra for support services.	Sprint-ready stories pushed into ServiceNow or Human approved Agentic remediation - you decide.
Ongoing	Quarterly snapshots. Findings that went stale. Risk still accumulating between reviews.	Re-scan on demand. Health score tracked over time with delta comparison showing exactly what's changed.

Who This Is For

Platform Owners Responsible for instance health. No systematic view of what's degraded or what to prioritize.	IT Leaders Accountable for platform ROI. Need financial evidence, not technical severity ratings.	Inheriting Architects Stepping into years of accumulated decisions. No complete inventory of what's broken or why.

Structured Investigation

16 compound analyzers run structured, step-by-step root cause analysis across your live ServiceNow data. This is not conversational search - it is guided reasoning that traces conditions across your platform and surfaces findings with evidence.

- CMDB health and relationship integrity
- Schema integrity and table structure
- Performance and query optimization
- Script hygiene and background job analysis
- License governance and role complexity
- ACL security and access control
- Upgrade readiness assessment
- 9 additional compound analyzers

Platform Capabilities

Complete diagnostic coverage. Every output built to drive action.

- CSDM maturity tracking from Foundation → Run; scored checklist per stage, visual progress dashboard
- Financial impact calculated per scan - operational waste, 3-yr ROI, payback period
- Executive PDF and full delivery report auto-generated, not manually assembled
- Multi-environment comparison across, risk tracked across your full pipeline
- Sprint-ready backlog stories generated directly from findings - no manual effort required
